Apache Geronimo Board Report

Releases

Genesis 2.0 was released using the apache 6 maven pom. This released better aligns Geronimo projects (and any other projects using Genesis) with standard Apache Maven best practices and release procedures.

Server

Significant progress has been made towards a 2.2 server release. We've worked with the Jetty project to integrate Jetty 7, including jaspis support.

Specs

Work has begun to implement some of the draft JavaEE 6 spec api jars. This has been complicated by the fact that some Specs are using outdated templates with restrictive licensing terms. Hopefully, this will be fixed soon. There are other issues, such as undocumented updates to jsr250 (annotations) for among other things the servlet 3.0 spec.

Sandbox

An implementation of the OSGi Blueprint specification has been largely completed. With the intent of using the implementation within a future version of the Geronimo server.

JUGs and Conferences

Policy Changes

The community discussed using the Apache Nexus installation for release and snapshot staging/deployment. The community decided to hold off on switching to this new process until after the Geronimo Server 2.1.4 release. As 2.1.4 was released, we have begun using Apache Nexus.

Other Issues and News

We received the jsr-196 (jaspi) tck from sun and have already received one update based on a challenge we filed.
