

# Email

## Warning

This component has been deprecated in favor to [servicemix-mail](#) component.

We currently support MIME email sending via [JavaMail](#). The following example shows the configuration of the JavaMail email sender component.

Error formatting macro: snippet: java.lang.NullPointerException

We also support the simpler [MailSender](#) from Spring, such as to work with [COS](#).

Error formatting macro: snippet: java.lang.NullPointerException

## Using message properties

The default configuration of the email sender uses the supplied message properties to figure out how to send the email. The following code shows this in use

Error formatting macro: snippet: java.lang.NullPointerException

## Using expressions

You can also use [Expressions](#) to configure the various properties on the email. The following example uses a mixture of constant expression and XPath expressions. This means that the sender component will use XPath to extract information from the message content and use that to create the email.

Error formatting macro: snippet: java.lang.NullPointerException

This example uses property expressions; that is extracting properties from the message.
