Developing a Simple JavaServer Faces application

{scrollbar}

This application will make you understand how Model(M), View(V), Controller(C) architecture is implemented in JavaServer Faces. This application will make use of UI components, Validator, Navigation and Bean component available with JSF.

Briefly describing the application, this application will take a user First Name and Last Name. Later these fields will be validated by JSF and using the controller bean and Navigation rule the output will be displayed. This application will also introduce a UI component which is a submit button.

To run this tutorial, as a minimum you will be required to have installed the following prerequisite software.

- Sun JDK 5.0+ (J2SE 1.5)
- Eclipse 3.3.1.1 (Eclipse Classic package of Europa distribution), which is platform specific
- Web Tools Platform (WTP) 2.0.1
- Data Tools Platform (DTP) 1.5.1
- Eclipse Modeling Framework (EMF) 2.3.1
- Graphical Editing Framework (GEF) 3.3.1

Details on installing eclipse are provided in the Development environment section. This tutorial is organized in the following sections:

The application development will take you through the following

Once you have all the pre-requisites installed follow the following steps to create a project with Eclipse

Setting Eclipse for Application development

1. Launch Eclipse and Create a dynamic web project as shown in the figure

Project Explore	er 8			
	New Show In	Alt+Shift	► +W	Project
	Copy	Ctrl+C I Name		Connector Project
	Paste Delete Build Path	Ctrl+V Delete	•	Si EJB Project Carrier Control Cont
	Import Import		٠	C Other
	🗞 Refresh	F5		

2. Give the fields for the Web Project as shown in the following figure

Dynamic Web Project Create a standalone Dynamic Web project or add it to a new or existing Enterprise Application. Project name: SimpleJSF Project contents: ✓ ✓ Use default Directory: C:\Documents and Settings\Administrator\ag\SimpleJSF Target Runtime Apache Geronimo v2.1 Runtime Configurations Default Configuration for Apache Geronimo v2.1 Runtime A good starting for working with Apache Geronimo v2.1 Runtime runtime. Additional facets can later b new functionality to the project. EAR Membership	Browse

Ore Mapping Patterns.	Add <u>A</u> dd <u>Remove</u>
0	< Back Next > Eirigh Cancel

This finishes the setting up of Eclipse IDE for application development

Define and Implement the application Model(M)

Model as suggested by MVC architecture handles data and logic of the application. In an enterprise application. Java Beans are used to represent collection of data and operation on that data. In JSF we use Java Beans to define the Model.

1. Under the project explorer right click on the SimpleJSF project and create a new class

놉 Project Exp	olorer 🛛		
		\$ ▽	
🗉 🔁 Simple	New		Project
	Show In	Alt+Shift+W	File
	Сору	Ctrl+C	😂 Folder
	E Copy Qualified Name		SQL File
	💼 Paste	Ctrl+V	@ Annotation
	💢 Delete	Delete	C Clarg
	Build Path		🚺 💕 Enum
	Refactor	Alt+Shift+T	📩 🗊 Interface
	Import		Parkane

2. Fill the New Java Class form with jsf as the package name and FirstName as the bean class name. Select Finish once done

😂 New Java Clas	SS	_ 🗆 🛛
Java Class Create a new Java	dass.	C
Source fol <u>d</u> er: Pac <u>k</u> age: Enclosing type:	SimpleJSF/src jsf	Browse Browse Browse
Na <u>m</u> e: Modifiers:	FirstName • gublic • default • private • protected • abstract • final • static •]
Superclass:	java.lang.Object	Browse
Interfaces:		<u>A</u> dd <u>R</u> emove
Which method stubs	would you like to create?	-
	public static void main(String[] args)	
	Constructors from superclass	
Do you want to add	 ✓ In<u>h</u>erited abstract methods comments as configured in the <u>properties</u> of the current pro <u>G</u>enerate comments 	ject?
?	Einirh	Cancel

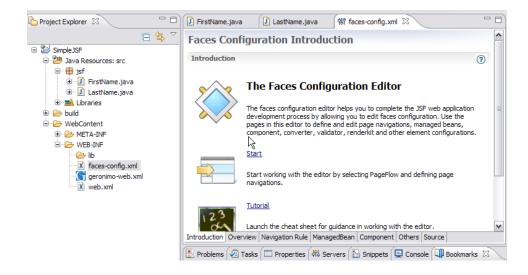

3. Add the following code to the FirstName bean class

JAVAsolidFirstName.java package jsf; public class FirstName { String username; public String getName() { return username; } public void setName(String name) { username = name; } }
4. Create a second Bean class LastName and add the following code to the class JAVAsolidLastName.java package jsf; public class LastName {

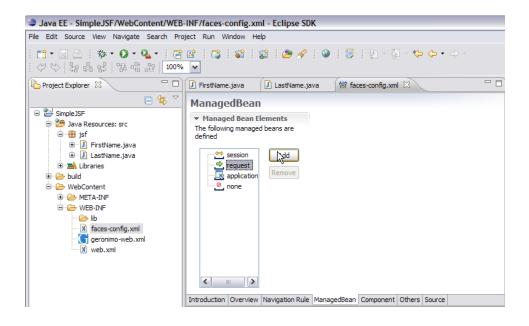

4. Create a second Bean class LastName and add the following code to the class JAVAsolidLastName.java package jsf; public class LastName { String lastname; public String getLName() { return lastname; } public void setLName(String Iname) { lastname = lname; } } This completes the Model definition and implementation of bean class.

Define and implement Model(M) objects to Controller

1. In an JSF application controller is implemented by a configuration file WebContent/WEB-INF/faces-config.xml. Double Click on the file. This will open a Faces Configuration Editor.

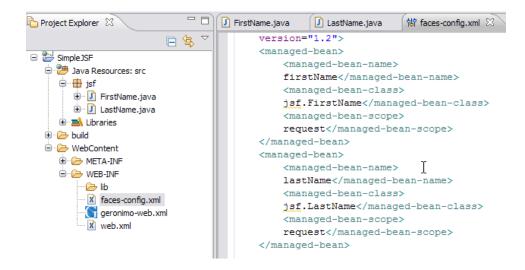

2. Select the ManagedBean tab in the editor. Choose Managed Bean of scope request and select Add.

3. Using the existing java class option, select Browse. Give the search element as FirstName and select ok.

Select Type	$\overline{\mathbf{X}}$
Select entries:	-
FirstName	
Matching items:	
● FirstName - jsf	
isf - SimpleJSF/src	
2	Cancel

4. Select Finish on the next window. Similarly add the other bean LastName. Now select the Source tab in the Faces configuration Editor. It displays the bean components(Model) in the controller.

This completes the description of Model to Controller.

Define and implement View(V) in application

1. Right Click on WebContent and create a New Folder with the name pages

New Folder	
Folder	4
Create a new folder resource.	
Enter or select the parent folder:	
SimpleJSF/WebContent	
 Image: Simple JSF Image: Simp	
Folder <u>n</u> ame: pages	
Advanced >>	
?	Einish Cancel

2. Right Click on pages folder and create a jsp page login.jsp. Select Finish.

New JavaServer Page	_ 🗆 🔀
JavaServer Page Create a new JavaServer Page.	
Enter or select the parent folder:	
SimpleJSF/WebContent/pages	
SimpleJSF Def Settings Settings Def Def Settings Def Def	
File name: login.jsp	
(2) < Back Next > Einlich	Cancel

- 3. Similarly create another jsp page welcome.jsp.
- 4. Moving forward now we now have to include Tag Library Descriptors(TLD) in our application.

Geronimo comes packaged with the TLD's required for application. The TLD's can be found in solidLocation of TLD <GERONIMO_HOME>\repository\org\apache\myfaces\core\myfaces-impl\1.2.2\myfaces-impl\1.2.2.jar\META-INF\myfaces-html.tld and <GERONIMO_HOME>\repository\org\apache\myfaces\core\myfaces-impl\1.2.2\myfaces-impl\1.2.2.jar\META-INF\myfaces_core.tld #To add these two TLD's in the application, In Eclipse Under project Explorer right click on WEB-INF. Create a folder tld. Copy myfaces-html.tld and myfaces_core.tld to this folder.

- 5. The first two lines in login jsp defines two tag libraries ActionScriptsolidCode Snippet from login jsp <%@ taglib uri="/WEB-INF/tld/myfaces-html. tld" prefix="h" %> and <%@ taglib uri="/WEB-INF/tld/myfaces_core.tld" prefix="f" %> These two sets of tags are defined by JSF. First one with the namespace "h" is used to generate html views. Second one with the namespace "f" handles the core functionalities of JSF like type conversions, validations and listeners for input from user.
- The next few lines contains the usual html tags ActionScriptsolidCode Snippet from login.jsp <html> <head> <meta http-equiv="Content-Type" content="text/html; charset=ISO-8859-1"> <title>Welcome to Apache Geronimo</title> </head> <body>
- 7. <f:view>- This tag represents the start of JSF code.
- ActionScriptsolidCode Snippet from login.jsp <h:inputText id="firstName" value="#{firstName.name}" required="true"> Represents the input tag. id="firstName" and value="firstName.name"
 Select firstName been under Managed Been tab. The Managed Been tab. The Managed Been Name
- comes from the Managed Bean. Use the Faces Configuration Editor, Select firstName bean under Managed Bean tab. The Managed Bean Name is firstName. See the figure below

\$\$° faces-config.xml 🛛 📑	welcome.jsp	🚺 FirstName.java	»2

		Name O	ass	Value
<				>
Introduction Overview Navigati	on Rule Manage	edBean Component O	thers Source	2

This completes the implementation of View(V) in the application.

The other tags <f:validateLength> and <h:commandButton> will be explained in the next section.

Define the Validator Component

The <f:validateLength minimum="4" maximum="10"/> defines the input text length to be minimum of 4 characters and maximum of 10 characters. This is the standard validation provided by core tag libraries. Other examples of validators are Validate Long Range Tag, Validate Double Range Tag etc. JSF also provides a Validator interface which can be implemented to create custom validators.

The code <h:message for="" style="color: red;"/> defines the error message. When the user inputs the controller Validates each of the inputs. If the inputs are invalid Controller displays the same page again with an error message for the errors. The color:red suggests that the error message will be displayed in red color.

Define and implement the View navigation by Controller(C)

This step suggests the JSP page navigation in the order of user inputs and validation by controller. If all the inputs are valid than the controller performs the action as suggested by the HTML form. This action is submitted by the HTML for as a command button.

The code in the input.jsp <h:commandButton id="submit" action="validated" value="Enter" /> suggests that if all the inputs are valid. This is the button which submits the form to controller if all inputs are valid.

In this case the commandButton tells the controller to execute the validated action if all the inputs are valid.

The pages navigation in a JSF is defined by faces-config.xml. Follow the underlined steps to define the pages navigation.

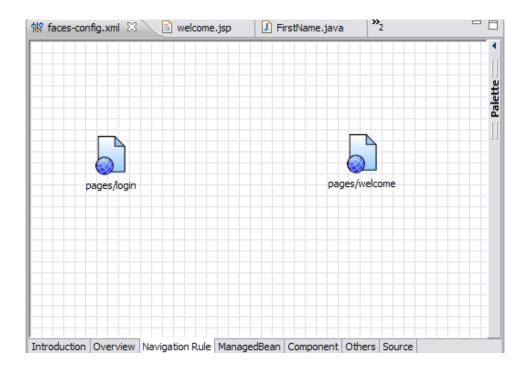

- 1. Launch the Faces Configuration Editor by double clicking on faces-config.xml
- 2. Select the Navigation tab in the Configuration Editor. Under the Palette window select Page. This will select a GUI object, page.

邻 faces-config.xml	🛛 📄 welcome	.jsp 📄 🚺 Fi	rstName.java	»2	
					≳ Select
					Marquee
				tte	Link
				Bal	Kunk ≥Nodes 🖈
					Page
					Creates a PageFlo
				<u>+++</u>	
Introduction Overvi	iew Navigation Rule	ManagedBean	Component	Others So	ource

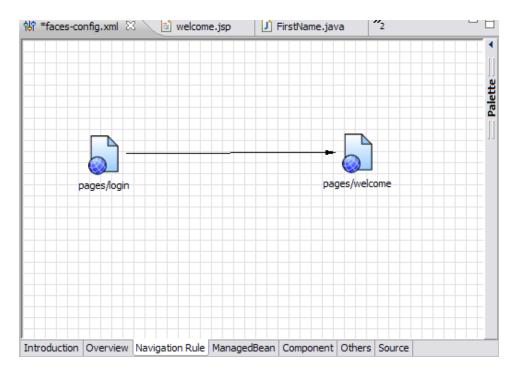

3. Drag the mouse over the Navigation Rule Window and click on the window. This will give a Select JSP file window. Select login.jsp as shown in the figure and select OK.

🗢 Select JSP File 🛛 🔀
Select JSP File
⊟ ≥ SimpleJSF ⇒ > WebContent
i in i webContent i i i i i i i i i i i i i i i i i i i
login.jsp welcome.jsp
⑦ Cancel

4. Similarly add the welcome.jsp page on the Navigation Rule window. See the figure below

5. Select Link from the Palette window and join the two pages as shown in the figure

6. Select the link and between the two pages and go to properties view and set the value for From Outcome field as validated. This is because of the tag <h:commandButton id="submit" action="validated" value="Enter" />. Once all the input are valid the action taken is validated. See the figure

\$\$ faces-config.	.xml 🛛 🔪 📑 w	elcome.jsp	J FirstName	.java	2

	From Outcome:	validated				
	Redirect:	false				

 Once done have a look the source tab in the Faces Navigation Editor. A <navigation-rule> tag has been introduced into the faces-config. xml. This rule suggests the Controller that if you all the inputs are valid from a form in the /pages/login.jsp, and the action is 'validated', then go to page /pages/welcome.jsp.

	~			
Introduction Overview Navigation Rule ManagedBean Component Others Source				

Now lets add a index.jsp under WEB-INF as follows ActionScriptsolidindex.jsp <%@ page language="java" contentType="text/html; charset=ISO-

8859-1"pageEncoding="ISO-8859-1"%> <\!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN" "http://www.w3.org/TR/html4 /loose.dtd"> <html> <body> <jsp:forward page="/pages/login.jsf" /> </body> </html> Now what is this **login.jsf** in the forward path. If you look at the web.xml *.jsf is used as the URL pattern to suggest that forwarded page be taken care by Java Server Faces Servlet. This completes the Application Development process. Next step is to deploy and test the application.

Deploy and Test the application

Right Click on the project SimpleJSF and Select Run As-> Run On Server. This will deploy the sample on Apache Geronimo Server and a Login page will be launched.

Welcome to Apa	che Geronimo 🕱	
🔶 🔿 🔳 🦑	http://localhost:8080/SimpleJSF/	Ð
Welco	me to Apache Geronimo	~
Enter your first	name	
Enter your last Enter	name	
		~

Lets give some sample inputs
Sample Input1:
First Name: Mickey
Last Name: Mouse
Both the First Name as well as Last Name fulfills the validation rules, so this form will be submitted to controller and according to the navigation rule
controller will launch a welcome.jsp page.

Welco	me 🖂				
$\Leftrightarrow \Rightarrow$	– \$	http://localhost:8080/SimpleJSF/pages/login.jsf;jsessionid=677244DI		Ð	
You have successfully Logged in, Mickey Mouse!					
				~	
Comple Inn					

Sample Input2: First Name: Mic

Last Name: Mouse

First Name should be minimum of length=4 but in this case First Name is of length=3. In this case validation will fail and an error message will be generated by controller for First Name field.

First Name: Mickey

Last Name: Mo

Last Name should be minimum of length=3 but in this case Last Name is of length=2. In this case validation will fail and an error message will be generated by controller for Last Name field.
